

STANDARD & LIGHTWEIGHT CMU

Block manufactured shall conform to the finish requirements of ASTM C90-08.

TECHNICAL DATA

Physical Properties & Ratings*

<u>Weight:</u> A standard 8x8x16 inch, thru-hole Partanna Masonry Unit weight is 38 lb (17.2 kg). A lightweight Partanna masonry unit is 26 lb (11.8 kg).

<u>Density:</u> 136.8 pcf for standard 8x8x16 inch unit; 96.5 pcf for a lightweight 8x8x16 inch unit

<u>Compressive Strength:</u> 3,674 psi for standard 8x8x16 inch unit; 3,290 psi for a lightweight 8x8x16 inch unit

<u>Fire Resistance Rating</u>: for an 8-inch CMU (unit only, not wall assembly) with empty cores: 1 ³/₄ hours for standard 8x8x16 inch unit, with an equivalent thickness of 3.8 inches.

<u>Thermal Resistance (R) and Transmittance (U)</u> <u>Ratings</u>: For 8-inch CMU, 85% density with empty cores

> R = 3.00 hr ft2 °F/Btu U = 0.333 Btu/ (hr ft2 °F)

UL Greenguard: Gold (Highest Rating)

Positive Environmental Impacts

kg CO₂-eq Avoided: 3.08 kg per block kg CO₂-eq Removed: 11.2 kg per block

ASTM Compliance

<u>ASTM C-90</u> Compressive Strength of Concrete Masonry – Composition conforms to the density, absorption and compressive strength requirements (see ASTM Table 2 below)

<u>ASTM C642</u> Water Absorption, Density, Voids in Hardened Concrete – Composition conforms

<u>ASTM C33/C33M</u> for aggregates – Composition conforms

🥼 C 90 – 12

TABLE 2 Strength, Absorption, and Density Classification Requirements

* Test reports are available upon request.

BUILDING 1, UNIT 7 & 8, OLD FORT BAY, TOWN CENTER, NASSAU, NEW PROVIDENCE, THE BAHAMAS INFO@PARTANNA.COM

EXECUTION

The installer is the final and most essential quality control inspector of these products. All units should be inspected prior to installation for tolerance, color and quality. Installation of any Partanna Block manufactured unit into the wall assumes inspection and approval of the products. Use constitutes acceptance.

Laying Masonry Walls

When installing pull blocks from more than one pallet at a time during installation, refer to NCMA TEK notes for Hot and Cold Weather construction practices. www.ncma.org

Lay units using the best concrete masonry practices. Lay blocks with faces level, plumb and true to the line strung horizontally at the finished face. Units shall have uniform, 3/8" wide joints both horizontally and vertically on the finished side of the wall. Tool joints neatly after they are thumb print hard. Make them straight and uniform. Size and place cut pieces appropriately to maintain consistency and bond. Complete masonry construction using procedures and workmanship consistent with the best masonry practices.

Installation

<u>Lighting:</u> Provide adequate lighting for masonry work by placing all lighting at a reasonable distance from the wall for even illumination. Do not use direct lighting.

<u>Cutting</u>: Make all unit cuts, including those for bonding, holes, and boxes, etc., with motor-driven masonry saws, using either an abrasive or diamond blade. Cut neatly and locate for best appearance.

Mortar Bedding and Jointing

- 1. Lay units with full mortar coverage on head and bed joints taking care not to block cores to be grouted or filled with masonry installation.
- 2. Tool and mortar joints when thumbprint hard into a concave configuration.
- 3. Care should be taken to remove mortar from the face of masonry units before it sets.
- 4. Tuckpoint the joints for proper appearance.

Flashing of Masonry Work

Install flashing at locations shown in the plans and in accordance with the best masonry flashing practices.

Weep Holes and Vents

Install weep holes and vents at proper intervals at courses above grade and at any water stops over windows, doors, and beams. INSPECTION The textured faces shall conform to the requirements of ASTM C90 when viewed from a distance of twenty (20) feet to the wall.

Cleaning

Keep walls daily during installation using brushes. Do not allow excess mortar to harden on the finished surface. Do not high-pressure wash. This may cause efflorescence.

Maintenance

When properly installed, Partanna CMU (Concrete Masonry Unit) need virtually no maintenance other than routine cleaning.

* Test reports are available upon request.

RE: Tests of Concrete Masonry Units

Further to our ongoing discussion with Partanna Global, Beton Consulting Engineers, LLC (Beton) is pleased to present this factual report of concrete masonry unit testing. This letter is intended to show that the previous testing shows compliance with ASTM C90

Wingerter Laboratories, INC. performed compressive strength and absorption testing on samples of 2 different batches of concrete masonry units. One batch was Identified as 8 LP (from report 2) and 8 S (from report 3). From each batch, 4 samples were broken for compressive strength, and 1 sample used for absorption. The testing from Wingerter conforms to ASTM C140 and the samples conform to ASTM C90 & C129. ASTM E119 was not performed as the fire ratings were calculated from the absorption and equivalent thickness values. ASTM C1314 is yet to be performed, and is normally used to judge the quality of the actual construction, and not the materials incorporated into the work.

ASTM C1314 – Standard Test Method for Compressive Strength of Masonry Prisms

- This testing has not been performed. In the test Masonry Prisms are frabicated using the proposed block and mortar. The test is normally used to check field production of walls based on block that meet the project specifications. It is a test of the quality of construction. It is nearly certain that the Partanna materials would meet the requirements.

ASTM E119 – Standard Test Methods for Fire Tests of Building Construction and Materials

- While a complete fire test in accordance with ASTM C119 has not been performed, Fire ratings given from absorption by ASTM C140 tests have been presented. The fire rating of E119 is also, like the ASTM C1314, a test of the entire wall system. The use of conforming blocks in systems that have already been tested is often an acceptable substitute.

ASTM C140 – Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units

- Masonry units conformed to ASTM C90 and ASTM C129
- Fire ratings given from ASTM C140 test reports are calculated from the absorption and web thickness of the units tested (Not from ASTM E119).
- Aggregates conformed to the requirements of ASTM C33.

The Table below presents a summary of the test results for the two types of materials tested as detailed above. They show compliance with the specified standards.

Sample ID	Total Load	Gross	Net	Equivalent	Fire Rating	Absorption
	(lbs)	Compressive	Compressive	Thickness	(hrs)	(%)
		Strength	Strength	(in)		
		(psi)	(psi)			
4 (8LP)	196400	1607	3294	3.8	1.75	
5 (8LP)	199570	1629	3347	3.8	1.75	
6 (8LP)	195580	1594	3280	3.8	1.75	8.9%
7 (8LP)	193250	1583	3241	3.8	1.75	
9 (8S)	207760	1696	3519	3.7	1.75	
10 (8S)	217910	1767	3691	3.8	1.75	
11 (8S)	220530	1802	3735	3.8	1.75	5.3%
12 (8S)	221460	1812	3751	3.7	1.75	

Table 1: Masonry Unit Testing Results.

We have calculated the Thermal resistance of the block based on the method found in ACI 122. The calculated values are as shown below:

R = 3.00 hr ft2 °F/Btu U = 0.333 Btu/ (hr ft2 °F)

We trust this letter is self-explanatory. If you should have any questions, please feel free to contact the undersigned at 612-363-7111 Sincerely,

Beton Consulting Engineers

GREENGUARD RESULTS SUMMARY

Product Description	Flooring-Building Product				
GREENGUARD Acceptable IAQ Criteria		168 Hour Product Measurement	Product Compliance for IAQ		
TVOC ^a	≤ 0.5 mg/m³	0.006 mg/m ³	Yes		
Formaldehyde	≤ 0.05 ppm	< 0.002 ppm	Yes		
Total Aldehydes ^b	≤ 0.10 ppm	< 0.002 ppm	Yes		
4-Phenylcyclohexene	≤ 0.0065 mg/m³	< 0.003 mg/m ³	Yes		
Individual VOCs	all ≤ 1/10 TLV	c	Yes		

^a "TVOC" is the sum of all VOCs measured via TD/GC/MS which elute between n-hexane (C_6) and n-hexadecane (C_{16}) quantified using calibration to a toluene surrogate.

^b "Total Aldehydes" is the sum of all measured normal aldehydes from formaldehyde to nonanal, plus benzaldehyde. Heptanal through nonanal are analyzed using TD/GC/MS. The remaining aldehydes are analyzed using HPL/UV methodology. All aldehydes are quantified to authentic standards.

° All individual VOCs detected met the criteria of less than 1/10 the ACGIH established threshold limit values (TLVs).

PROJECT DESCRIPTION

This study was conducted using a UL Environment's GREENGUARD test method following the requirements of GREENGUARD Certification program. The product was monitored for emissions of total volatile organic compounds (TVOC), formaldehyde, target list aldehydes, and other individual volatile organic compounds (VOCs) over a 168-hour exposure period. These emissions were measured, and the resultant air concentrations were determined for each of the potential pollutants. Determination of compliance is based on predicted air concentrations modeled using the GREENGUARD program room loading.

Report Outline:

ENVIRON	MENTAL CHAMBER S	STUDY PARAMETE	ERS			
Product Description	Flooring-Building Produ	ct				
Product Manufacture Date	Not Provided					
Product Collection Date	Not Provided					
Product Shipping Date	June 16, 2023					
Date Received	June 19, 2023					
Test Description	The product was received by UL Environment as packaged and shipped by the customer. The package was visually inspected and stored in a controlled environment immediately following sample check-in. Just prior to loading, the product was unpackaged and prepared for the required loading to expose the finished surfaces only. The sample was placed inside the environmental chamber and tested according to the specified protocol.					
Test Period	June 23, 2023 – June 3	0, 2023				
Area	one-sided area = 0.1024	4 m²				
Environmental Chamber ID and Volume	SE2 - 0.0868 m³					
Product Loading	1.18 m²/m³					
Test Conditions	1.00 ± 0.05 ACH 50% RH ± 5% RH 22.6℃ - 24.5℃	1.00 ± 0.05 ACH 50% RH ± 5% RH 22.6°C - 24.5°C				
*Accredited Laboratory	Testing Laboratory	Analytical Laboratory	Technical Reporting Location			
Locations	ULE - Marietta	ULE - Marietta	ULE - Marietta			

**Unable to confirm product meets all GREENGUARD sampling requirements. Date(s) not provided on the Chain of Custody.

The temperature range specification is $23^{\circ}C \pm 1^{\circ}$. The actual temperature range listed above may vary slightly. If the range is outside this specification, data was reviewed to ensure a negative impact did not occur.

	*Accredited Laboratory Locations

SUPPLEMENTAL EMISSIONS INFORMATION

The table below represents this product's identified chemical emissions found on certain regulatory lists. This list only provides a statement regarding possible health effects associated with this compound and not the relative risks of exposure. Proper interpretation of the risks associated with exposure to a given regulated compound requires a more detailed evaluation of toxicological activity. Certain purchasing programs may require this information be submitted.

CAL Prop. 65: California Health and Welfare Agency, Proposition 65 Chemicals 1 = known to cause cancer 2 = known

NTP: National Toxicology Program 2A = known to be carcinogenic to humans 2 = known to cause reproductive toxicity

4 = probably not carcinogenic to humans

2B = reasonably anticipated to be carcinogenic to humans

3 = unclassifiable as to carcinogenicity to humans

IARC: International Agency on Research of Cancer

1 = carcinogenic to humans

2A = probably carcinogenic to humans

2B = possibly carcinogenic to humans

California Air Toxics

- I = Substances identified as Toxic Air Contaminants, known to be emitted in California, with a full set of health values reviewed by the Scientific Review Panel.
- IIA = Substances identified as Toxic Air Contaminants, known to be emitted in California, with one or more health values under development by the Office of Environmental Health Hazard Assessment for review by the Scientific Review Panel.
- IIB= Substances NOT identified as Toxic Air Contaminants, known to be emitted in California, with one or more health values under development by the Office of Environmental Health Hazard Assessment for review by the Scientific Review Panel.
- III = Substances known to be emitted in California and are NOMINATED for development of health values or additional health values.
- IVA = Substance identified as Toxic Air Contaminants, known to be emitted in California and are TO BE EVALUATED for entry into Category III.
- IVBA =Substance NOT identified as Toxic Air Contaminants, known to be emitted in California and are TO BE EVALUATED for entry into Category III.
- V = Substance identified as Toxic Air Contaminants, and NOT KNOWN TO BE EMITTED from stationary source facilities in California based on information from the AB 2588 Air Toxic "Hot Spots" Program and the California Toxic Release Inventory.
- VI = Substances identified as Toxic Air Contaminants, NOT KNOWN TO BE EMITTED from stationary source facilities in California, and are active ingredients in pesticides in California.
- CREL: California Office of Environmental Health's Hazard Assessment (OEHHA), Chronic Reference Exposure Levels. The GREENGUARD program does not include all Chronic Reference Exposure Levels (CRELs) adopted by the State of California Office of Environmental Health Hazard Assessment (OEHHA). For example, caprolactam and 2-butoxyethanol.

Carbon Credit Offerings

Q2 2023 Partanna Production Scenarios

Removal & Avoidance Credits

Partanna's technology has the ability to generate both avoidance and removal carbon offsets. Several scenarios of potential credit generation are illustrated here, with the supporting calculations:

- CMU block
- Applied CMU block with mortar
- 1,250 ft² home
- 100,000 m² pavers

Avoidance credits. Partanna's innovative carbon-negative building material is just as affordable, versatile, and durable as traditional cement. However its manufacturing process completely eliminates the use of Portland cement and is made from an alternative binder that uses natural or recycled ingredients, including materials reclaimed from brine and pozzolans such as steel slag. This binder is mixed with natural, recycled stones and cured at ambient temperature. Thus, the technology enables Partanna to generate avoidance credits from the displacement of cement.

Removal credits. Another major advantage is that this mix of materials can generate removal credits, through its absorption of CO_2 – both at production and throughout the life of the concrete. Approximately 20% of the removals occur during the initial curing period, and then the concrete continues to significantly absorb carbon over the next 20 years. Concrete made with this technology captures CO_2 directly from the air and mineralizes it in the concrete.

Timing of credit generation. Each scenario below breaks out how many removal credits are generated in the initial curing period and the remaining period over the material's lifetime, so that stakeholders can see how many credits would be available and according to what timeline.

ΙΙΙΙΙΙΙ

CMU Block

Consider:

- 1. Each Partanna Masonry Unit = 0.0076 m³ volume of concrete, 38.5 lb (17.5 kg)
- Carbon Removal, 11.2 kg (24.6 lb): Partanna block material testing confirms CO₂ absorption of 32 kg CO₂/mt/yr [1]

So, for one block: 17.5 kg X 0.001 mt/kg X 32 kg CO $_2$ /mt/yr X 20 yrs = 11.2 kg CO $_2$

3. **Carbon Avoidance, 3.08 kg (6.83 lb)**: Partanna Masonry Units avoid 405 kg CO_2/m^3 [2] So: 0.0076 m³ X 405 kg CO_2/m^3 = 3.08 kg of CO_2 is avoided per block

Total Carbon Credit Potential (Avoidance + Removal) = 11.2 kg + 3.1 kg = 14.3 kg (31.4 lb) per block

Initial Period Total: 5.3 kg

Remaining Period Total Over Lifetime: 9 kg

Applied CMU Block

Consider:

- Carbon Removal, 22.6 kg (49.8 lb): 11.2 kg (block, above) + [For Mortar/Filling] 11.2 kg CO₂/block X 1.02 kg mortar/kg block = 22.6 kg CO₂
- Carbon Avoidance, 6.22 kg (13.7 lb):
 3.08 kg (block, above) + 3.08 kg CO₂/block X 1.02 kg mortar/kg block = 6.22 kg CO₂
- 3. Total Carbon Credit Potential (Avoidance + Removal) = 28.8 kg (63.5 lb) per block

Initial Period Total: 10.7 kg

Remaining Period Total Over Lifetime: 18.1 kg

One House - 1,250 ft²

182.6 credits (79.9 Initial + 102.7 Lifetime); 128.4 Removal + 54.2 Avoidance

Consider:

- 1. Each Partanna House uses 3,000 applied CMU blocks
- 2. In addition to the mortar and fill for the applied CMU blocks, each Partanna home includes 62.9 m³ of Partanna concrete in the foundation, slab, porch, roof tiles, driveway and sidewalks.

Carbon Removal 128.4 credits (25.7 Initial + 102.7 Lifetime)

1. **Applied CMU blocks, 67.8 credits:** Each applied Partanna block, mortar and fill removes 22.6 kg (see above)

So, the blocks from each house 22.6 kg X 3,000 blocks/house= 67,800 kg CO₂ or 67.8 mt (credits)

2. Foundations, footings, slab, porch, roof tiles, driveway and sidewalks, 60.6 credits:

Partanna block material testing confirms CO_2 absorption of 32 kg CO_2 /mt/yr [1]. Density of the concrete is 1,505 kg/m³(or 94 lb/ft³)

So:62.9 m³ X 1,505 kg/m³ X 0.001 mt/kg X 32 kg CO₂/mt/yr X 20 yrs

= 60,585 kg or 60.6 mt CO_2 (credits)

The total removal is roughly equivalent to 12,230 trees [3]

Carbon Avoidance, 54.2 credits

1. Applied CMU blocks, 18.7 credits: Each applied Partanna block avoids 6.24 kg (see above)

So, the blocks from each house avoid 6.24 kg X 3,000 blocks/house = 18,720 kg CO₂ or 18.7 mt (credits)

 Foundations, footings, slab, porch, roof tiles, driveway and sidewalks, 25.5 credits: Partanna concrete avoids 405 kg CO₂/m³

So: 62.9 m³ X 405 kg CO₂/m³ = 25,475 kg or 25.5 mt (credits) of CO₂

- Additional avoidances from building process, 10 credits: Conservatively, each Partanna house avoids 10 mt of CO₂ by eliminating the need for a number of high-carbon emitting building materials.
- 4. Total Carbon Credit Potential (Avoidance) = 18.7 mt + 25.5 mt + 10 mt (credits)
 = 54.2 credits per house

Total Carbon Credit Potential (Removal + Avoidance) = 128.4 mt + 54.2 mt

= 182.6 credits per house

Initial Credits Total: 79.9

Remaining Credit Total Over Lifetime: 102.7

^{2.} Dupont EPD High Test CMU 900003403, Aug. 31, 2021, https://www.basalite-cmu.com/_files/ugd/31fd52_c399e811721a4fa4b9fe9cf4bd91c2e6.pdf 3. For a medium growth, coniferous tree https://www.epa.gov/indoor-air-quality-iaq/introduction-indoor-air-quality

Pavers - Installing 100,000 m² of Pavers

Consider:

1. Partanna pavers are 3 in. thick (0.2286 m).

So, 100,000 $\textrm{m}^2\,\textrm{of}$ pavers is made of 22,860 \textrm{m}^3

2. Density of the concrete is 1,505 kg/m³ (or 94 lb/ft³)

So: 22,860 m³ X 1,505 kg/m³ X 0.001 mt/kg = 34,404 mt concrete is used in pavers

Carbon Removal 22,018 credits

- 3. Partanna block material testing confirms CO₂ absorption of 32 kg CO₂/mt/yr [1]
- 4. So, 34,404 mt X 32 kg $CO_2/mt/yr$ X 20 yrs X 0.001 mt/kg = 22,018 mt CO_2 is removed from the atmosphere

That removal is roughly equivalent to 1.35 million trees

Carbon Avoidance, 9,258 credits

- 5. Partanna avoids $405 \text{ kg CO}_2/\text{m}^3$
- 6. So: 22,860 m³ X 405 kg CO_2/m^3 = 9,258,300 kg or 9,258 mt of CO_2 is potentially avoided from 100,000 m² of pavers

Total Carbon Credit Potential (Removal + Avoidance) = 22,018 mt + 9,258 mt (credits) = 31,276 credits

Initial Credits Total: 13,661

Remaining Credit Total Over Lifetime: 17,614

Trees Equivalency

Unlike a tree, Partanna's products do not need to be watered. In fact, with Partanna's brine-based technology, fresh water is not required at all.

Consider:

According to the U.S. EPA [3] CO_2 absorption equivalency for a medium-growth coniferous tree allowed to grow for 10 years is 23.2 lb CO_2 (10.5 kg)

So:

1. 1 CMU Block **≅** 1 tree:

Each block removes 11.2 kg, which is equivalent one tree

2. 1 Applied CMU Block **≅** 2 trees:

Each Applied CMU block removes 20.4 kg, which is equivalent to two trees

3. 1,250 ft² house ≅ 12,230 trees:

Each 1,250 ft² home removes 128.4 mt, which is equivalent to 12,230 trees

100,000 m² Pavers ≅ a forest of over 1.38 million trees: 100,000 m² removes 22,018 mt (22,018,000 kg), which is equivalent to a forest with over 1.38 million trees

Note that this equivalency only factors in Partanna's net carbon removal. It does not account for the avoided emissions.

Partanna Carbon Removal

2023 Summary of Testing Results at Trent University

Building 1, Unit 7 & 8, Old Fort Bay, Town Center, Nassau, New Providence, The Bahamas Info@Partanna.Com

Overview

In May of 2022, Partanna contracted Trent University, to conduct testing on various Partanna material samples to determine the CO2 removal rates [1]. The purpose of the tests were to determine the potential CO_2 removal both at atmospheric and high CO_2 concentrations during the following timeframes:

- Immediately after initial curing
- In the time period after initial curing

Three types of samples were tested:

- Lab-cured cement coupons (mortar)
- Brick (porous) samples
- Tile (compressed product) samples

Results confirm that brick, tile, and lab-made cement coupons remove CO₂ from the atmosphere and offer a significant, fast and permanent sink for atmospheric CO₂. As evidenced by the increase in total inorganic carbon of lab-made coupons when compared to the brick and tile samples, CO₂ removal rates are faster during the curing than after curation.

Atmospheric CO₂ conditions

Even at atmospheric CO₂ conditions and concentrations, the aged brick (porous sample) **removes CO₂ at a rate of 32 kg/t/yr** (**Table 1**). Meanwhile, the lab-made coupons confirm 33-50 kg/t/yr at atmospheric conditions, which is 9-56% faster than the results for the aged brick samples. **These results confirm the conservative assumption that 20% of the absorption occurs during initial curing.**

High CO₂ concentrations

The results in a high CO_2 environment show that the rate of carbonation could increase anywhere from 38% to more than 200% under these conditions. However, the cost and energy demand of doing so seems unnecessary given the promising results at atmospheric conditions.

Discussion of the various research activities and their relevance

Testing Activity	Samples Tested	CO2 Removal Rate [1] (Atmospheric CO ₂)
Activity 1 – Times-series analysis of total inorganic carbon (TIC) with atmospheric CO ₂	Lab-cured cement coupons (mortar)	33-50 kg/t/yr
Activity 2 – Time-series analysis of TIC with atmospheric CO_2	Brick and compressed tile samples	18 kg/t/yr; 0.42 kg/m ² /yr
Activity 3 – Time-series analysis of TIC at high CO ₂ conditions	Brick and Compressed tile samples	25 kg/t/yr; 0.69 kg/m ² /yr -
Additional Activity $1 - CO_2$ drawdown experiments, monitoring change of CO_2 concentrations in a closed container	Brick and compressed tile samples	32 kg/t/yr; 0.72 kg/m²/yr 11 kg/t/yr; 0.19 kg/m²/yr

When reviewing the attached report, keep the following in mind:

- Additional Activity 1 provides the most reliable result. For the purposes of calculating the CO₂ absorption for Partanna materials, it is better to use the results of "Additional activity 1" (CO₂ Drawdown Experiment), which measures the net carbon removed from the closed atmosphere.and is therefore independent of carbonate spatial variability within the sample.
- Sample compositions and ages are not identical. It is also important to note that the cement coupons are not identical to the brick and tile samples that were tested in Activities 2 and 3. For example, the lab-made coupons likely have different porosities than the brick and tile. The brick sample is representative of Partanna pavers, CMUs and poured in place foundations, mortar, etc. Meanwhile, the brick and tile samples were over 3 months old when testing began, and over 9 months old upon completion. So, the brick and tile results are more indicative of the slower mineralization rates that occurs after initial curing.
- **Testing confirms initial absorption assumption of 20%.** The main conclusion from Activities 1-3 is that the carbon removal in the coupons (which represents carbonation upon initial curing) is at least 32% faster than the rates that occur in subsequent months. This confirms the conservative assumption that at least 20% occurs during the first curing year.
